

BOLTING TORQUE DATA

Torque required to Produce Bolt Stress

Torque, is the measurement of the turning or twisting force applied to an object. This desired result is to hold two parts together with a tension or clamping force that is greater than any external force that could possibly separate them. The part then remains under constant stress and is immune to fatigue. The torque required to produce a certain stress in bolting is dependent upon a number of conditions, some of which are:

- Diameter of bolt
- Type and number of threads on bolt.
- Material on bolt.
- Condition of nut bearing surfaces.
- Lubrication of bolt threads and nut bearing surfaces.

The tables below reflect the results of many tests to determine the relation between torque and bolt stress. Values are based on steel bolting well lubricated with a heavy graphite and oil mixture. It was found that a non-lubricated bolt has an efficiency of about 50% of a well lubricated bolt and also that different lubricants produce results varying between the limits of 50% - 100% of the tabulated stress figures

Nominal Diameter of Bolt (inches)	Number of Threads (per inch)	Diameter at Root of Thread (inches)	Area at Root of Thread (sq. inch)	STRESS					
				30,000 psi		45,000 psi		60,000 psi	
				Torque Ft/Lbs	Compression Lbs	Torque Ft/Lbs	Compression Lbs	Torque Ft/Lbs	Compression Lbs

Data for use with Alloy Steel Stud Bolts

Load in Pounds on Stud Bolts when Torque Loads are applied.
